

## DIAMOND BLADES

### CONSTRUCTION APPLICATION

Having the segment patented design and our welding technology our blades have the ability to run wet and dry i.e. with or without coolant. This technology allows us to produce blades for construction applications which are more demanding on the segment / core joint. Further in demanding construction applications cooling can be uneven which can lead to breakage of the segment which is protected by our advanced welding technique.

Our offer for construction blades is for various applications such as flooring sawing, wall sawing etc. Our segment design such as the double-notched with the layered diamond distribution allows for fast cutting. In the construction industry time is a demanding factor which we complement by our fast cutting blades.
